RESIDENTIAL

More and more people are building their homes out of steel trusses.

Not only are they stronger than wood, but they allow the owner to make the choice in the room sizes and locations because the interior walls are not required to be load bearing. Worldwide Steel Buildings' system offers the owner the opportunity to use steel or

wood for the secondary framing, and with the secondary framing on 2' centers, the interior can be finished off without having to build additional interior stud walls. Second floors are easy with our exclusive bar joist system and porches are available with or without legs. Dress the exterior with stucco or brick if you're wanting a different look. Worldwide buildings are the most versatile and strongest buildings available.
